Acids, Bases, and Solutions - Adapted Reading and Study

## Acids and Bases in Solution (pages 242-247)

## Acids and Bases in Solution (pages 242-243)

Key Concept: An acid is any substance that produces hydrogen ions $\left(\mathrm{H}^{+}\right)$in water. A base is any substance that produces hydroxide ions $\left(\mathrm{OH}^{-}\right)$in water.

- When acids are mixed with water, hydrogen ions and negative ions form. A hydrogen ion $\left(\mathrm{H}^{+}\right)$is an atom of hydrogen that has lost its electron. This is what happens when hydrochloric acid mixes with water:

$$
\mathrm{HCl} \rightarrow \mathrm{H}^{+}+\mathrm{Cl}^{-}
$$

- Hydrogen ions are important to the way acids react with other compounds. Hydrogen ions react with blue litmus paper and turn it red.
- The hydroxide ion $\left(\mathrm{OH}^{-}\right)$is a negative ion made of oxygen and hydrogen. When bases dissolve in water, the positive ions and negative ions separate. This is what happens to sodium hydroxide:

$$
\mathrm{NaOH} \rightarrow \mathrm{Na}^{+}+\mathrm{OH}^{-}
$$

- Hydroxide ions cause the bitter taste and slippery feel of bases. Hydroxide ions turn red litmus paper blue.

Answer the following questions. Use your textbook and the ideas above.

1. $A(A n)$ $\qquad$ produces hydrogen
ions $\left(\mathrm{H}^{+}\right)$in water.
2. $A(A n)$ $\qquad$ produces hydroxide
ions $\left(\mathrm{OH}^{-}\right)$in water.

## Strength of Acids and Bases (pages 244-245)

## Key Concept: A low pH tells you that the concentration of hydrogen ions is high. In contrast, a high pH tells you that the concentration of hydrogen ions is low.

- Acids may be strong or weak. A strong acid produces more hydrogen ions when dissolved in water than a weak acid.
- Bases may be strong or weak. A strong base produces more hydroxide ions when dissolved in water than a weak base.
- The pH scale is a range of numbers from 0 to 14 . The pH tells the concentration of hydrogen ions in a solution. If a solution has a high concentration of hydrogen ions, it is an acid. A pH lower than 7 is acidic. Strong acids have very low pH numbers.
- If a solution has a low concentration of hydrogen ions, it is a base. A pH higher than 7 is basic. Strong bases have very high pH numbers.
- A pH equal to 7 means that the solution is neither an acid nor a base. The solution is neutral. Pure water has a pH of 7 .

Answer the following questions. Use your textbook and the ideas above.
3. Circle the letter of what a strong acid has.
a. many hydroxide ions $\left(\mathrm{OH}^{-}\right)$
b. many hydrogen ions $\left(\mathrm{H}^{+}\right)$
c. few hydrogen ions $\left(\mathrm{H}^{+}\right)$
$\qquad$

4. Look at the pH scale below. Circle the part of the scale where the basic substances are.
pH Scale

## Acid-Base Reactions (pages 246-247)

Key Concept: In a neutralization reaction, an acid reacts with a base to produce a salt and water.

- A reaction between an acid and a base is called a neutralization reaction. An example of a neutralization reaction is:

$$
\mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{Na}^{+}+\mathrm{Cl}^{-}
$$

- The reactants in a neutralization reaction are an acid $(\mathrm{HCl})$ and a base $(\mathrm{NaOH})$.
- One product of a neutralization reaction is water. The other product is a salt. A salt is any ionic compound made from the positive ion of a base and the negative ion of an acid.

Answer the following questions. Use your textbook and the ideas above.
5. A reaction between an acid and a base is called a(an)
$\qquad$ reaction.
6. One product of a neutralization reaction is $\mathrm{a}(\mathrm{an})$
$\qquad$ .
